

## AI for Formulas in Excel

| Term                      | Definition                                                                                                         |
|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>ChatGPT</b>            | A language-based AI model developed by OpenAI used for generating, explaining, and fixing Excel formulas.          |
| <b>Custom GPT</b>         | A personalized version of ChatGPT created using GPT-4 to perform specific tasks, such as Excel formula assistance. |
| <b>Excel Formula</b>      | A function or expression written in Excel to perform calculations, manipulate data, or return specific results.    |
| <b>Formula Auditing</b>   | The process of reviewing and verifying Excel formulas to ensure correctness and efficiency.                        |
| <b>Gemini</b>             | Google's language-based AI model used for tasks like interpreting, writing, and debugging Excel formulas.          |
| <b>INDIRECT Function</b>  | An Excel function that returns the reference specified by a text string, often used for dynamic sheet referencing. |
| <b>Language Model</b>     | An AI trained to understand and generate human language, including formula and code syntax.                        |
| <b>Prompt Engineering</b> | The practice of crafting clear and specific prompts to obtain accurate and efficient responses from AI models.     |
| <b>SUMPRODUCT</b>         | An Excel function that multiplies arrays and then sums the results, often used with conditions.                    |
| <b>TEXTSPLIT Function</b> | An Excel function that splits a text string into an array based on a specified delimiter.                          |
| <b>Workday Function</b>   | An Excel function that returns a date representing the next working day based on a given start date.               |
